

# Endomorphisms of Boolean Algebra

**Norio YAMAUCHI**

## Abstract

We study endomorphisms  $\ell = x_1 + \cdots + x_n$  and  $\partial = \partial_1 + \cdots + \partial_n$  of a boolean algebra  $A$ .

We express  $A$  as the direct sum of the eigen spaces of  $\ell\partial$  or  $\partial\ell$ .

As a corollary, we give an elementary and direct proof of strong Lefscetz property of  $A$ .

## Key words

Boolean algebra, eigenvalue, Lefshetz property

Let  $K$  be an algebraically closed field of characteristic 0 and let

$$A = K[X_1, \dots, X_n]/(X_1^2, \dots, X_n^2)$$

be a boolean algebra in  $n$  variables over  $K$ . We put  $x_i = X_i \bmod (X_1^2, \dots, X_n^2)$ .

We define  $K$ -endomorphisms  $\ell$  and  $\partial$  of  $A$  as follows:

$$\begin{aligned} \ell(a) &= (x_1 + \cdots + x_n)a \text{ for } a \in A, \text{ and} \\ \partial(x_{\alpha_1} \cdots x_{\alpha_i}) &= \sum_k x_{\alpha_1} \cdots \hat{x}_{\alpha_k} \cdots x_{\alpha_i} \text{ for a monomial } x_{\alpha_1} \cdots x_{\alpha_i} \text{ of } A. \end{aligned}$$

We remark that  $\partial$  is induced by a derivation  $\sum_i \partial/\partial_{x_i}$  of  $K[X_1, \dots, X_n]$ , but is *not* a derivation of  $A$ .

Let  $A_i$  is the set of homogenous elememnts of degree  $i$  of  $A$ . Then

$$A = A_0 \oplus A_1 \oplus \cdots \oplus A_n$$

as a  $K$ -vector space. We put  $\ell_i = \ell|_{A_i}$  and  $\partial_i = \partial|_{A_i}$  for  $0 \leq i \leq n$ . Further we put  $A_{-1} = A_{n+1} = (0)$ , and define  $\ell_{-1} = 0$  and  $\partial_{n+1} = 0$  (zero maps).

LEMMA 1 . For  $0 \leq i \leq n$ , we have

$$\partial_{i+1} \ell_i - \ell_{i-1} \partial_i = (n - 2i) \mathbf{1}_{A_i}.$$

**Proof.** For a monomial  $m_\alpha = \prod_j x^{\alpha_j}$  in  $A_i$ , we put  $\alpha = \{\alpha_1, \dots, \alpha_i\}$  (a subset of  $n = \{1, \dots, n\}$ ). We have

$$\begin{aligned} (\partial_{i+1} \ell_i - \ell_{i-1} \partial_i)(m_\alpha) &= \partial_{i+1} \left( \sum_{\beta \in n \setminus \alpha} x_\beta m_\alpha \right) - \ell_{i-1} \left( \sum_{j=1}^i \frac{m_\alpha}{x_{\alpha_j}} \right) \\ &= \sum_{\beta \in n \setminus \alpha} \left( m_\alpha + \sum_{j=1}^i x_\beta \frac{m_\alpha}{x_{\alpha_j}} \right) - \sum_{j=1}^i \left( m_\alpha + \sum_{\beta \in n \setminus \alpha} x_\beta \frac{m_\alpha}{x_{\alpha_j}} \right) \\ &= (n - i) m_\alpha - i m_\alpha = (n - 2i) m_\alpha. \end{aligned}$$

□

Let  $M_i$  be the set of monomials of  $A$  of degree  $i$  ( $0 \leq i \leq n$ ). Then  $M_i$  is a  $K$ -basis of  $A_i$ .

We denote by  $M_i$  (resp.  $N_i$ ) the matrix of  $\ell_i$  (resp.  $\partial_i$ ) with respect to  $M_i$  ( $0 \leq i \leq n$ ).

**LEMMA 2.** (1)  $N_i = {}^t M_{i-1}$  for  $1 \leq i \leq n$ .

(2)  $M_i = N_{n-i}$  for  $0 \leq i \leq n-1$ .

(3)  $M_i = {}^t M_{n-i-1}$  for  $0 \leq i \leq n-1$ .

(4)  $N_i = {}^t N_{n-i+1}$  for  $1 \leq i \leq n$ .

**Proof.** For the monomials  $m_\alpha = x_{\alpha_1} \cdots x_{\alpha_n} \in M_i$  and  $m_\beta = x_{\beta_1} \cdots x_{\beta_{n-i}} \in M_{i+1}$ ,

$$m_\alpha \text{ occurs in } \partial_i(m_\beta) \Leftrightarrow m_\beta \text{ occurs in } \ell_{i-1}(m_\alpha)$$

$$\Leftrightarrow \frac{x_1 \cdots x_n}{m_\beta} \text{ occurs in } \partial_{n-i} \left( \frac{x_1 \cdots x_n}{m_\alpha} \right).$$

Hence we have (1) and (2).

(3) and (4) follows from (1) and (2).  $\square$

**COROLLARY 3.** The endmorphisms  $\partial_{i+1} \ell_i$  and  $\ell_{i-1} \partial_i$  are diagonalizable.

**Proof.** By LEMMA 2, the matrix of  $\partial_{i+1} \ell_i$  (resp.  $\ell_{i-1} \partial_i$ ) with respect to a basis  $M_i$  is  $M_i M_i$  (resp.  ${}^t M_{i-1} M_i$ ). Since these matrices are symmetric and their components are integers,  $\partial_{i+1} \ell_i$  and  $\ell_{i-1} \partial_i$  are diagonalizable.  $\square$

Let  $E_i$  be the set of eigenvalues of  $\partial_{i+1} \ell_i$  and let  $E'_i$  be the set of eigenvalues of  $\ell_{i-1} \partial_i$  for  $0 \leq i \leq n$ .

**PROPOSITION 4.** For  $0 \leq i \leq [(n-1)/2]$ , we have

(1)  $E_i = \{(n-2i+j)(j+1) \mid 0 \leq j \leq i\}$ .

(1)'  $E'_i = E_{i-1} \cup \{0\}$ .

(2)  $E_i = E'_{n-i}$  and  $E'_i = E_{n-i}$ .

**Proof.** Since  $\dim A_{i-1} \leq \dim A_i$ , (1)' follows from the following well known result:

**SUBLEMMA 5.** Let  $M$  be an  $(r, s)$  matrix,  $N$  an  $(s, r)$  matrix in  $K$ . Then

$$\Phi(MN, t) = t^{r-s} \Phi(NM, t),$$

where  $\Phi(\cdot, t)$  denotes the characteristic polynomial of a matrix.

We prove (1) by induction on  $i$ .

The case  $i = 0$  follows immediately from LEMMA 1.

Assume  $i > 0$ . We have  $E_i = \{\lambda + n - 2i \mid \lambda \in E'_i\}$  by LEMMA 1, and  $E'_i = \{(n-2(i-1)+j)(j+1) \mid 0 \leq j \leq i-1\} \cup \{0\}$  by (1)'. Hence we get the assertion by the induction hypothesis.  $\square$

(2) is clear by LEMMA 2.

**COROLLARY 6.** (1)  $\partial_{i+1} \ell_i$  is bijective for  $0 \leq i \leq [(n-1)/2]$ .

(2)  $\ell_{i-1} \partial_i$  is bijective for  $[n/2] + 1 \leq i \leq n$ .

**Proof.** (1) By (1) of PROPOSITION 4, each eigenvalue of  $\partial_{i+1} \ell_i$  is a positive integer for  $0 \leq i \leq [(n-1)/2]$ , hence the assertion follows.

Similarly (2) follows from (2) of PROPOSITION 4.  $\square$

**COROLLARY 7.** (1)  $\ell_i$  is injective for  $0 \leq i \leq [(n-1)/2]$  and surjective for  $[n/2] \leq i \leq n$ .

(2)  $\partial_i$  is surjective for  $0 \leq i \leq [(n-1)/2]$  and injective for  $[n/2] \leq i \leq n$ .

**Proof.** Clear by COROLLARY 6.  $\square$

We put

$$A_i(\lambda) = \{a \in A_i \mid \partial_{i+1} \ell_i(a) = \lambda a\}, \text{ and}$$

$$A'_i(\lambda) = \{a \in A_i \mid \ell_{i-1} \partial_i(a) = \lambda a\} \quad (0 \leq i \leq n)$$

for  $\lambda \in K$

**LEMMA 8.** For  $0 \leq i \leq n$ ,

- (1)  $A_i(\lambda) = A'_i(\lambda - n + 2i)$ .
- (2)  $A_i(0) = \text{Ker } \ell_i$ .
- (3)  $A'_i(0) = \text{Ker } \partial_i$ .

**Proof.** (1) Immediate from LEMMA 1.

(2) For  $0 \leq i < [n/2]$ ,  $A_i(0) = \text{Ker } \ell_i = (0)$  by COROLLARY 6 and 7. For  $i \geq [n/2]$ ,  $\partial_{i+1}$  is injective and hence  $\text{Ker } \ell_i = \text{Ker } \partial_{i+1} \ell_i = A_i(0)$ .

The proof of (3) is similar to (2) and we omit it.  $\square$

**PROPOSITION 9.** For  $0 \leq i \leq n$  and  $\lambda \in E_i \setminus \{0\}$ , we have

$$\ell_i|A_i(\lambda): A_i(\lambda) \xrightarrow{\sim} A'_{i+1}(\lambda + n - 2(i+1)).$$

**Proof.** By LEMMA 8, it suffices to show  $\ell_i|_{A_i}(\lambda): A_i(\lambda) \xrightarrow{\sim} A'_{i+1}(\lambda)$ . Assume  $a \in A_i(\lambda)$ . Then  $\ell_i \partial_{i+1} \ell_i(a) = \ell_i(\lambda a) = \lambda \ell_i(a)$ , hence  $\ell_i(a) \in A'_{i+1}(\lambda)$ .

Since  $\lambda \neq 0$ ,  $\ell_i|_{A_i(\lambda)}$  is injective. Moreover if  $b$  is an element of  $A'_{i+1}(\lambda)$ , we have  $b = \ell_i \partial_{i+1}(\lambda^{-1} b)$ . Hence  $\ell_i|_{A_i(\lambda)}: A_i(\lambda) \xrightarrow{\sim} A'_{i+1}(\lambda)$  is surjective.  $\square$

Now we can prove the main result.

**THEOREM 10.** (1)  $A_i = \ell_{i-1}(A_{i-1}) \oplus \text{Ker } \partial_i$  for  $0 \leq i \leq [(n+1)/2]$ .

(2)  $A_i \simeq \bigoplus_{\lambda \neq 0} A_{i-1}$  for  $[n/2] + 1 \leq i \leq n$ .

**Proof.** (1) By LEMMA 8 and PROPOSITION 9,

$$\begin{aligned} A_i &= \bigoplus_{\lambda \in E_i} A_i(\lambda) \\ &= (\bigoplus_{n-2 \leq i \neq \lambda \in E_i} A_i(\lambda)) \oplus A'_i(0) \\ &= (\bigoplus_{\lambda \in E_{i-1}} \ell_{i-1}(A_{i-1}(\lambda))) \oplus \text{Ker } \partial_i \\ &= \ell_{i-1}(A_{i-1}) \oplus \text{Ker } \partial_i. \end{aligned}$$

for  $0 \leq i \leq [(n+1)/2]$ .

(2) If  $[n/2] + 1 \leq i \leq n$ , then

$$\begin{aligned} A_i &= \ell_i(A_{i-1}) \\ &= \ell_i(\bigoplus_{\lambda \in E_{i-1}} A_{i-1}(\lambda)) \\ &= \ell_i(\bigoplus_{0 \neq \lambda \in E_{i-1}} A_{i-1}(\lambda)) \\ &\simeq \bigoplus_{0 \neq \lambda \in E_{i-1}} A_{i-1}(\lambda) \end{aligned}$$

$\square$

**COROLLARY 11.** For  $0 \leq i \leq [n/2]$

(1) The  $K$ -endomorphism  $\ell_{n-i-1} \cdots \ell_i: A_i \rightarrow A_{n-i}$  is an isomorphism.

(2) The  $K$ -endomorphism  $\partial_{i+1} \cdots \partial_{n-i}: A_{n-i} \rightarrow A_i$  is an isomorphism.

**REMARK 12.** (1) of COROLLARY 11 means that  $A$  has the strong Lefshetz property. Although this is already known (see e.g. [1]), here we gave an elementary proof.
